Nama: Rizqi Hendra Ardiansyah

Kelas: SIB-4C

NIM: 2141762145

No.Absen: 11

Objectives

Part 1: Gather End User Device Settings

Part 2: Gather Information about Network Devices

Part 3: Diagnose Connectivity Issues

Background / Scenario

In this Packet Tracer (PT) activity, you will use various commands to gather device information and troubleshoot device configuration and connectivity issues. Device information includes IP address, default gateway, and DNS server settings. These settings are critical to enable a device to communicate on networks and connect to the internet.

Instructions

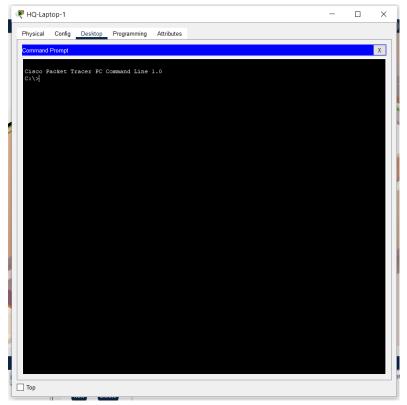

Part 1: Gather End User Device Settings

In this part, you will document the IP address settings for end devices.

Step 1: Document the IP address settings for HQ-Laptop-1.

a. The activity opens in the **HQ** cluster. The **Wiring Closet** is the tall, black chassis in the bottom left corner of the first floor. Locate all the devices on the first floor: PCs 1-1, 1-2, 1-3, and 1-4; printer **FL-1P**; and **HQ-Laptop-1**.

b. Click **HQ-Laptop-1** > **Desktop** tab > **Command Prompt**.

c. Enter the **ipconfig** command.

Which IPv4 address is displayed for the Wireless0 Connection?

169.254.0.0/16 address, because the wireless connection not may not be established

It may show as 169.254.0.0/16 address because the wireless connection may not be established yet. The address will be within the 192.168.50.0/24 network.

If the IPv4 address is in the 169.254.0.0/16 range, what method is being used to assign IPv4 addresses? Why is the laptop assigned an IPv4 address in the 169.254.0.0/16 range?

IPv4 addresses are in the range 169.254.0.0/16, the method used to set these addresses is APIPA (Automatic Private IP Addressing). APIPA automatically assigns an IP address to a device when the device fails to obtain an IP address from a DHCP server.

It indicates that the device was unable to obtain addressing from a DHCP server. Therefore, the device assigned itself an address 169.254.0.0/16 pool used for automatic private IP addressing (APIPA).

If the IPv4 address is in the 169.254.0.0/16, wait a few seconds and repeat the ipconfig command

Because the Laptop is unable to obtain IP Address from DHCP and instead using APIPA as a Fallback MechanismIf the IPv4 address is in the 169.254.0.0/16, wait a few seconds and repeat the **ipconfig** command.

When the IPv4 address is no longer from 169.254.0.0/16 range, what is the IP addressing information displayed? Record your answers in the table below.

Wireless0	IP Addressing Information
Link-local IPv6 Address	FE80::20A:F3FF:FEE4:EEAA
IPv6 Address	::
IPv4 Address	192.168.50.3
Subnet Mask	255.255.255.0
Default Gateway	192.168.50.1
DNS Servers	Empty

Wireless0	IP Addressing Information
Link-local IPv6 Address	FE80::20A:F3FF:FEE4:EEAA
IPv6 Address	::
IPv4 Address	192.168.50.4 (it may vary, but will be within the 192.168.50.0/24 range)
Subnet Mask	255.255.255.0
Default Gateway	192168.50.1
DNS Servers	N/A

Do you see a DNS server address? Explain.

Nothing, because ipconfig doesn't show any of the DNS Server Address

The ipconfig command does not report the DNS server address.

d. Enter the ipconfig /all command.

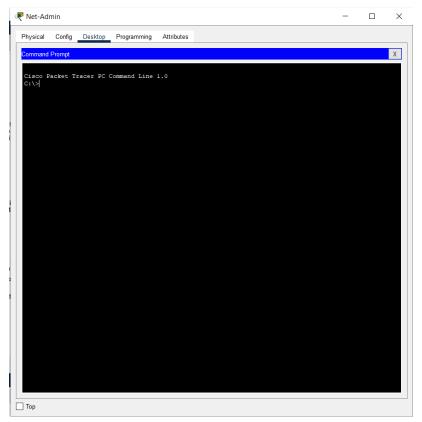

Do you see the DNS server address? What is it?

The DNS server address is 10.2.0.125

10.2.0.125

Step 2: Document the IP address settings for Net-Admin.

a. Click Wiring Closet > Net-Admin > Desktop tab > Command Prompt.

b. Enter the **ipconfig /all** command.

```
Physical Config Desktop Programming Attributes

Command Prompt

Cisco Facket Tracer FC Command Line 1.0
C:\>ipconfig /all

FastEthernet0 Connection:(default port)

Connection-specific DNS Suffix.:
Physical Address. : 0001.C910.22D6
Link-local IFv6 Address. : FE80::201:C9FF:FE10:22D6
IFv6 Address. : 192.168.99.9
Subnet Mask. : 255.255.255.0
Default Gateway. : 192.168.99.1
DHCP Servers. : 0.0.0.0
DHCPv6 Linen DuID : 00-01-00-01-67-A3-E9-BD-00-01-C9-10-22-D6
DNS Servers. : 100.2.0.125

Bluetooth Connection:

Connection-specific DNS Suffix.:
Physical Address : 11
IFv6 Address : 11
IFv6
```

What is the IP addressing information displayed under the FastEthernet0 interface? Record your answers in the table below.

FastEthernet0	IP Addressing Information
Physical Address	001.C910.22D6
Link-local IPv6 Address	FE80::201:C9FF:FE10:22D6
IPv6 Address	::
IPv4 Address	192.168.99.9
Subnet Mask	255.255.255.0
Default Gateway	192.168.99.1
DNS Servers	10.2.0.125

FastEthernet0	IP Addressing Information
Physical Address	0001.C910.22D6 (it may vary)
Link-local IPv6 Address	FE80::201:C9FF:FE10:22D6
IPv6 Address	::
IPv4 Address	192.168.99.9
Subnet Mask	255.255.255.0
Default Gateway	192168.99.1
DNS Servers	0.0.0.0

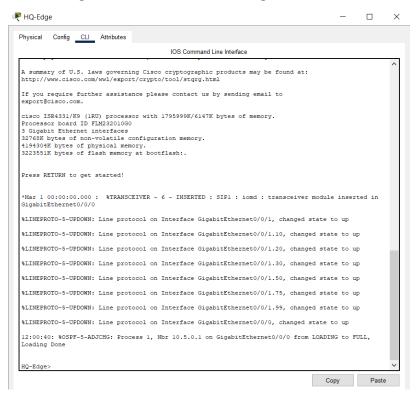

Part 2: Gather Information about Network Devices

In this part, you will document information about the link to ISP. You will then document the IP addressing information for all the end devices in HQ and discover that devices belong to different virtual local area networks (VLANs).

Step 1: Gather network connection information about the link between HQ and ISP.

The **HQ-Edge** router is the router between the HQ network and the ISP. We need to identify the upstream device information located in the ISP.

a. In the Wiring Closet left rack, click HQ-Edge > CLI tab.

- b. Press Enter to get the HQ-Edge> prompt, and then enter the enable command.
- c. Enter the show ip route | begin Gateway command.

```
HQ-Edge>show ip route | begin Gateway
Gateway of last resort is 0.0.0 to network 0.0.00

10.0.0.0/8 is variably subnetted, 6 subnets, 4 masks
0 10.0.0.0/29 [110/2] via 10.0.0.49, 00:09:19, GigabitEthernet0/0/0
0 10.0.0.32/29 [110/2] via 10.0.0.49, 00:09:19, GigabitEthernet0/0/0
1 10.0.0.38/29 is directly connected, GigabitEthernet0/0/0
1 10.0.0.50/32 is directly connected, GigabitEthernet0/0/0
0 10.0.3.0/24 [110/3] via 10.0.0.49, 00:09:19, GigabitEthernet0/0/0
0 10.2.0.0/16 [110/2] via 10.0.0.49, 00:09:19, GigabitEthernet0/0/0
192.168.10.0/24 is directly connected, GigabitEthernet0/0/0
192.168.10.0/24 is directly connected, GigabitEthernet0/0/1.10
1 192.168.10.0/24 is directly connected, GigabitEthernet0/0/1.10
1 192.168.20.0/24 is directly connected, GigabitEthernet0/0/1.20
1 192.168.30.0/24 is directly connected, GigabitEthernet0/0/1.20
1 192.168.30.0/24 is directly connected, GigabitEthernet0/0/1.20
1 192.168.30.0/24 is directly connected, GigabitEthernet0/0/1.30
1 192.168.30.0/24 is directly connected, GigabitEthernet0/0/1.30
1 192.168.30.0/24 is directly connected, GigabitEthernet0/0/1.30
1 192.168.30.0/24 is directly connected, GigabitEthernet0/0/1.50
1 192.168.50.0/24 is directly connected, GigabitEthernet0/0/1.50
1 192.168.75.0/24 is directly connected, GigabitEthernet0/0/1.50
1 192.168.99.0/24 is directly connected, GigabitEthernet0/0/1.75
1 192.168.99.0/24 is directly connected, GigabitEthernet0/0/1.99
1 192.168.99.0/24 is directly connected, GigabitEthernet0/0/1.99
1 192.168.99.0/24 is directly connected, GigabitEthernet0/0/1.99
```

What is the address for the gateway of last resort (or default gateway)? the address for the gateway is 0.0.0.0

0.0.0.0

Why is the next hop address not displayed?

Because there is still not explicitly configured

It is not explicitly configured.

c. Enter the show running-config | begin ip route command.

How is the default route configured? Does it use the next hop address?

The default route is configured with the outbound interface, not the next hop address.

It is configured with the exit interface instead of next hop address.

d. Enter the show cdp neighbors detail command.

```
HQ-Edge>show cdp neighbors detail

Device ID: ISP
Entry address : 10.0.0.49
Platform: cisco PT1000, Capabilities: Router
Interface: GigabitEthernet0/0/0, Port ID (outgoing port): GigabitEthernet1/0
Holdtime: 147

Version:
Cisco Internetwork Operating System Software
IOS (tm) PT1000 Software (PT1000-I-M), Version 12.2(28), RELEASE SOFTWARE (fc5)
Technical Support: http://www.cisco.com/techsupport
Copyright (c) 1986-2005 by cisco Systems, Inc.
Compiled Wed 27-Apr-04 19:01 by miwang
advertisement version: 2
Duplex: full
```

What is the IPv4 address of the next hop (ISP) address?

the IPv4 is 10.0.0.49

10.0.0.49

Which port on the ISP router is connected to HQ-Edge?

GigabitEthernet 1/0

GigabitEthernet 1/0

What IOS version is used on the ISP router?

IOS (tm) PT1000 Software (PT1000-I-M), Version 12.2(28), RELEASE SOFTWARE (fc5)

IOS (tm) PT1000 Software (PT1000-I-M), Version 12.2(28), RELEASE SOFTWARE (fc5)

e. Enter the ping 10.0.0.49 command.

```
HQ-Edge>ping 10.0.0.49

Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.0.0.49, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 0/0/0 ms
```

f. Enter the **show arp** command.

```
| HQ-Edge>show arp | Protocol Address | Age (min) | Hardware Addr | Type | Interface | Internet 10.0.0.49 | 17 0060.2FE1.903B | ARPA | GigabitEthernet0/0/0 | Internet 10.0.0.50 | - 0000.0C99.CB04 | ARPA | GigabitEthernet0/0/0
```

What is the MAC address of the interface on the **ISP** router that is connected to **HQ-Edge**? 0060.2FE1.903B

0060.2FE1.903B

h. Close **HQ-Edge** and exit the **Wiring Closet**.

Step 2: Gather network connection information about the devices in HQ.

a. From 1-1, 1-2, 1-3, 1-4, FL-1P, and HQ-Laptop-1, use the ipconfig command to find their IPv4 addresses and Default Gateways.

Device	IPv4 Address	Default Gateway
1-1	Connection-specific DNS Suffix.: Link-local IPv6 Address	192.168.10.1
1-2	Connection-specific DNS Suffix.: Link-local IPv6 Address: FE80::202:4AFF:FE8A:D20E IPv6 Address: IPv4 Address: 192.168.10.3 Subnet Mask	192.168.10.1
1-3	FastEthernet0 Connection:(default port) Connection-specific DNS Suffix.: Link-local IPv6 Address	192.168.20.1
1-4	FastEthernet0 Connection: (default port) Connection-specific DNS Suffix.: Link-local IPv6 Address	192.168.20.1
FL-1P	P Configuration	192.168.50.1
HQ-Laptop-1	Wireless0 Connection:(default port) Connection-specific DNS Suffix.: Link-local IPv6 Address: FE80::20A:F3FF:FEE4:EEAA IPv6 Address:: IPv4 Address: 192.168.50.3 Subnet Mask: 255.255.255.0 Default Gateway:: 192.168.50.1	192.168.50.1

Device	IPv4 Address	Default Gateway
1-1	192.168.10.2	192.168.10.1
1-2	192.168.10.3	192.168.10.1

Device	IPv4 Address	Default Gateway
1-3	192.168.20.2	192.168.20.1
1-4	192.168.20.3	192.168.20.1
FL-1P	192.168.50.2	192.168.50.1
HQ-Laptop-1	192.168.50.3	192.168.50.1

b. From PC 1-1, open Command Prompt, and then enter the arp -a command.

```
C:\>arp -a
No ARP Entries Found
```

What information is displayed?

No ARP Entries Found

No ARP Entries Found.

c. Use the ping command to ping 1-2, 1-3, 1-4, FL-1P, and HQ-Laptop-1.

1-2

```
C:\>ping 192.168.10.3

Pinging 192.168.10.3 with 32 bytes of data:

Reply from 192.168.10.3: bytes=32 time<lms TTL=128
Ping statistics for 192.168.10.3:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in mill1-seconds:
    Minimum = Oms, Maximum = Oms, Average = Oms</pre>
```

1-3

```
C:\>ping 192.168.20.2

Pinging 192.168.20.2 with 32 bytes of data:

Request timed out.

Reply from 192.168.20.2: bytes=32 time=1lms TTL=127

Reply from 192.168.20.2: bytes=32 time<1ms TTL=127

Reply from 192.168.20.2: bytes=32 time<1ms TTL=127

Ping statistics for 192.168.20.2:

Packets: Sent = 4, Received = 3, Lost = 1 (25% loss),

Approximate round trip times in milli-seconds:

Minimum = 0ms, Maximum = 1lms, Average = 3ms
```

1-4

```
C:\>ping 192.168.20.3
Pinging 192.168.20.3 with 32 bytes of data:

Request timed out.
Reply from 192.168.20.3: bytes=32 time=10ms TTL=127
Reply from 192.168.20.3: bytes=32 time<\lms TTL=127
Reply from 192.168.20.3: bytes=32 time<\lms TTL=127
Ping statistics for 192.168.20.3:
    Packets: Sent = 4, Received = 3, Lost = 1 (25% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 10ms, Average = 3ms</pre>
```

HQ-Laptop-1

```
C:\>ping 192.168.50.3

Pinging 192.168.50.3 with 32 bytes of data:

Request timed out.

Reply from 192.168.50.3: bytes=32 time=3ms TTL=127

Reply from 192.168.50.3: bytes=32 time=17ms TTL=127

Reply from 192.168.50.3: bytes=32 time=15ms TTL=127

Ping statistics for 192.168.50.3:

Packets: Sent = 4, Received = 3, Lost = 1 (25% loss),

Approximate round trip times in milli-seconds:

Minimum = 3ms, Maximum = 17ms, Average = 11ms
```

d. Enter the **arp -a** command.

```
C:\>arp -a
Internet Address Physical Address Type
192.168.10.1 000a.41ea.6b47 dynamic
192.168.10.3 0002.4a8a.d20e dynamic
```

What information is displayed?

Internet Address	Physical Address	Type
192.168.10.1	000a.41ea.6b47	dynamic
192.168.10.3	0002.4a8a.d20e	dynamic

```
Internet Address Physical Address Type
192.168.10.1 000a.41ea.6b47 dynamic
192.168.10.3 0002.4a8a.d20e dynamic
ARP provides a table that maps known MAC addresses to their associated IP addresses.
```

Why do the entries in the ARP table not contain information about devices in the 192.168.20.0 and 192.168.50.0 networks while the ping is successful?

Because 192.168.10.0/24, 192.168.20.0/24, and 192.168.50.0/24 are on different VLANs.

192.168.10.0/24, 192.168.20.0/24, and 192.168.50.0/24 are on different VLANs. Ping from 192.168.10.0 network to other VLAN networks would need to go through the default gateway first. Therefore, the ARP table only contains the information about devices within the same network or the same VLAN.

e. To find the route a packet takes to reach the DNS server, enter the tracert 10.2.0.125 command.

```
C:\>tracert 10.2.0.125

Tracing route to 10.2.0.125 over a maximum of 30 hops:

1 0 ms 0 ms 0 ms 192.168.10.1
2 0 ms 0 ms 0 ms 10.0.0.49
3 0 ms 0 ms 10.2.0.125

Trace complete.
```

What information is displayed?

Tracing route to 10.2.0.125 over a maximum of 30 hops:

```
1 0 ms 0 ms 0 ms 192.168.10.1
2 0 ms 0 ms 0 ms 10.0.0.49
3 0 ms 0 ms 0 ms 10.2.0.125
```

Trace complete.

How many routers, or hops, are between PC 1-1 and the DNS server?

2 routers or hops.

2

Part 3: Diagnose Connectivity Issues

In this part, you will use a variety of diagnostic commands and techniques. You will use the **nslookup** command to query a DNS server and troubleshoot a DNS database. You will then diagnose why a ping fails but web access is successful. Finally, you will use the **netstat** command to discover which ports are listening on the target device.

Step 1: Test a URL to investigate a connectivity issue.

- a. On PC 1-1, close the Command Prompt, and then click Web Browser.
- b. Enter the URL test.ptsecurity.com.

Does the web page display? If not, what is the message?

No, and the message is Host Name Unresolved

No, it does not. The message is "Host Name Unresolved― .

b. Enter the IP address 192.168.75.2.

Does the web page display?

Yes

Yes

Why does the web page display by using the IP address but not the domain name?

Because the PC can't resolve the domain name

The PC cannot resolve the domain name to the IP address.

Step 2: Use the nslookup command to verify DNS service.

- a. Close Web Browser, and then click Command Prompt.
- b. Enter the **ping test.ptsecurity.com** command.

```
C:\>ping test.ptsecurity.com
Ping request could not find host test.ptsecurity.com. Please check the name and try again.
```

What message is displayed?

Ping request could not find host test.ptsecurity.com. Please check the name and try again.

Ping request could not find host test.ptsecurity.com. Please check the name and try again.

What does the message indicate?

The DNS / Domain is not in the database of the DNS Server

The DNS entry is not in the database of the DNS server.

c. Enter the nslookup test.ptsecurity.com command.

```
C:\>nslookup test.ptsecurity.com

Server: [10.2.0.125]
Address: 10.2.0.125

*** UnKnown can't find test.ptsecurity.com: Non-existent domain.
```

What message is displayed?

Server: [10.2.0.125] Address: 10.2.0.125

*** UnKnown can't find test.ptsecurity.com: Non-existent domain.

```
Server: [10.2.0.125]
Address: 10.2.0.125
*** UnKnown can't find test.ptsecurity.com: Non-existent domain.
```

Which server is the default DNS server?

10.2.0.125

10.2.0.125

d. The **nslookup** command supports the use of alternate DNS server. Enter the **nslookup** /? command to learn options available for the command.

e. Enter the nslookup test.ptsecurity.com 192.168.99.3 command and press Enter.

Note: Packet Tracer may take several seconds to converge.

```
C:\>nslookup test.ptsecurity.com 192.168.99.3

Server: [192.168.99.3]
Address: 192.168.99.3

DNS request timed out.

timeout was 15000 milli seconds.

Server: [192.168.99.3]
Address: 192.168.99.3

Non-authoritative answer:
Name: test.ptsecurity.com
Address: 192.168.75.2
```

What message is displayed?

C:\>nslookup test.ptsecurity.com 192.168.99.3

Server: [192.168.99.3] Address: 192.168.99.3 DNS request timed out.

timeout was 15000 milli seconds.

Server: [192.168.99.3] Address: 192.168.99.3

Non-authoritative answer:

Name: test.ptsecurity.com

Address: 192.168.75.2

```
C:\> nslookup test.ptsecurity.com 192.168.99.3

Server: [192.168.99.3]

Address: 192.168.99.3

Non-authoritative answer:

Name: test.ptsecurity.com

Address: 192.168.75.2
```

In Step 2c, why is the domain name unable to be resolved?

Because when the domain name is entered the PC cannot resolve through the DNS Server.

When a domain name is entered in the URL box, the PC is trying to resolve it through the default DNS server. In this case, the default DNS server does not contain the information in its database.

Step 3: Use output from the ping command to diagnose connectivity issues.

a. Enter the ping mail.cybercloud.com command.

```
C:\>ping mail.cybercloud.com

Pinging 172.19.0.4 with 32 bytes of data:

Request timed out.
Request timed out.
Request timed out.
Request timed out.
Ping statistics for 172.19.0.4:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

What message is displayed?

C:\>ping mail.cybercloud.com

Pinging 172.19.0.4 with 32 bytes of data:

Request timed out.

Request timed out.

Request timed out.

Request timed out.

Ping statistics for 172.19.0.4:

Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),

```
C:\> ping mail.cybercloud.com
Pinging 172.19.0.4 with 32 bytes of data:

Request timed out.
Request timed out.
Request timed out.
Request timed out.
Ping statistics for 172.19.0.4:
Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

What information is indicated by the message?

The DNS name is successful, but the ping fail because either the host is disabled, or the reply from the host is disabled

The DNS name resolution is successful. However, the ping failed. Possible reasons are that the host is inactive or the ICMP echo/echo-reply is disabled on the host.

b. Enter the **ping www.ptsecurity.com** command.

```
C:\>ping www.ptsecurity.com
Pinging 10.0.0.3 with 32 bytes of data:
Request timed out.
Request timed out.
Reply from 10.0.0.3: Destination host unreachable.
Reply from 10.0.0.3: Destination host unreachable.
Ping statistics for 10.0.0.3:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

What message is displayed?

C:\>ping www.ptsecurity.com

Pinging 10.0.0.3 with 32 bytes of data:

Request timed out.

Request timed out.

Reply from 10.0.0.3: Destination host unreachable.

Reply from 10.0.0.3: Destination host unreachable.

Ping statistics for 10.0.0.3:

```
Packets: Sent = 4, Received = 0, Lost = 4 (100\% loss),
```

```
Pinging 10.0.0.3 with 32 bytes of data:
Request timed out.
Request timed out.
Reply from 10.0.0.3: Destination host unreachable.
Reply from 10.0.0.3: Destination host unreachable.

Ping statistics for 10.0.0.3:
Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

What information is indicated by the message?

The firewall in the path that blocks the ping

There is a firewall in the path that blocks the ping to the destination.

c. Close the Command Prompt, open Web Browser, and then navigate to www.ptsecurity.com.

Does the web page display?

Yes of course

Yes

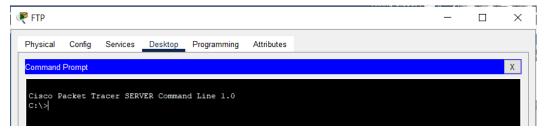

What conclusion can be drawn?

The web host is already running, even though the ping is blocked

The web host is running; however, the ping to the web server is blocked.

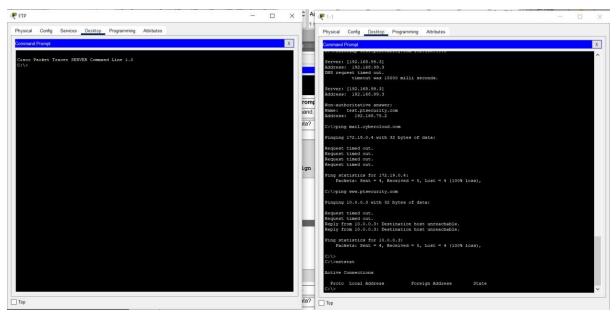

Step 4: Use the netstat command to find active and listening ports.

- a. Close Web Browser, and reopen Command Prompt.
- b. In HQ, click the Wiring Closet
- c. From the right rack, click the **FTP** server > **Desktop** tab > **Command Prompt**.

d. Arrange the PC 1-1 and FTP server Command Prompt windows side by side.

e. From the PC 1-1 window, enter the **netstat** command.

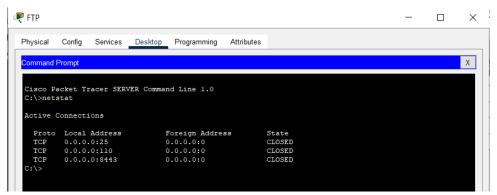

What message is displayed? Does it show any data?

C:\>netstat

  TCP
```

Does the displayed information change?

Yes, with a entry shows of TCP 192.168.75.2:21 192.168.10.2:1030 CLOSED

Yes. A new entry shows TCP 192.168.75.2:1028 192.168.10.3:1028 CLOSED.

What is indicated by this new entry?

New TCP Connection is opened to transfer file in the FTP directory and the connection is closed when the operation is complete

A new TCP connection is opened to transfer the file names in the FTP directory and the connection is closed after the operation completes.

o. From **PC 1-1**, enter the **put Sample2.txt** command and press **Enter**. This will upload the Sample2.txt file to the **FTP** server.

```
ftp>put Sample2.txt
Writing file Sample2.txt to 192.168.75.2:
File transfer in progress...
[Transfer complete - 43 bytes]
43 bytes copied in 0.078 secs (551 bytes/sec)
```

p. From the **FTP** server, enter the **netstat** command.

Does the displayed information change?

Yes, A new new entry shows of TCP 192.168.75.2:1030 192.168.10.3:1029 is closing

Yes. A new entry shows:

TCP 192.168.75.2:1030 192.168.10.3:1029 CLOSING.

q. Wait for a few seconds and then enter the netstat command again.

Does the displayed information change?

Yes, Because the entry that is supposed to be in there is already gone

Yes. The "CLOSING― line is gone.

r. From **PC 1-1**, enter the **quit** command.

```
ftp>quit
221- Service closing control connection.
```

s. From the FTP server, enter the netstat command.

```
C:\>netstat
Active Connections
  Proto Local Address
                                Foreign Address

                                                        CLOSED
  TCP
         0.0.0.0:8443
                                0.0.0.0:0
                                                        CLOSED
         192.168.75.2:21
                                192.168.10.2:1031
                                                        CLOSED
  TCP
```

Does the displayed information change?

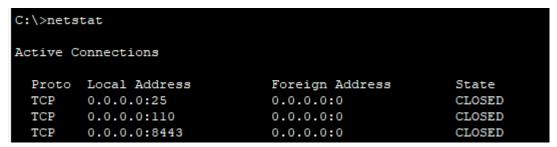

Yes, now the connection of TCP 192.168.75.2:21 192.168.10.2:1031 is already CLOSED

Yes. Now the TCP connection between 192.168.75.2:21 and 192.168.10.2:1027 is CLOSED.

- t. From PC 1-1, close Command Prompt, and then open Web Browser.
- u. Navigate to 192.168.75.2.

v. From the **FTP** server, enter the **netstat** command.

Does the displayed information change?

Yes, a new entry appears indicating that the TCP connection between 192.168.75.2 on port 80 (the web server) and 192.168.10.2 on port 1030 (the requesting host) is now closed.

Yes. A new entry shows TCP 192.168.75.2:80 192.168.10.2:1030 CLOSED.

What does this new entry indicate?

The host at 192.168.10.2 makes a request for a web page. The page is successfully delivered and displayed on PC 1-1's web browser, after which the TCP connection is closed.

A web page request is made by the host 192.168.10.2. The web page is transmitted (displayed on the web browser of PC 1-1) and the TCP connection is closed.
